RESUMEN

Una asignación eficiente de recursos entre los sectores público y privado de una economía requiere que tanto la carga de los ingresos públicos como el beneficio de los gastos públicos sean plenamente perceptibles y conocidos por los contribuyentes y los consumidores de los bienes y servicios provistos. Por diversas y complejas razones, esta visibilidad es actualmente insuficiente en los países de la OCDE, y se ha hecho necesario emplear indicadores adecuados y operativos para cuantificarla. Sobre la base de aportaciones aparecidas recientemente en Estados Unidos, esta contribución presenta nuevas y reveladoras estimaciones referidas al nivel central de gobierno de los diversos países miembros de la Unión Europea y a los niveles estatal y federal de Estados Unidos, estimaciones que han sido obtenidas a partir de datos estadísticos e informaciones procedentes del Fondo Monetario Internacional. Asimismo, de las oportunas comparaciones se extraen conclusiones útiles tanto para facilitar una mayor integración económica entre los países europeos como para detectar si se producen sesgos sistemáticos hacia una sobreprovisión o subprovisión públicas de bienes y servicios, orientándose con ello las futuras reformas de los sistemas fiscales vigentes.

I. INTRODUCTION

Improvements in the efficient allocation of resources between the private and public sectors of an economy - as well as among its several public sub-sectors - can be reached insofar as both public revenue and expenditure possess *visibility*, that is to say, the *burden* of public revenue and the *benefit* of public expenditure should be fully noticeable by individuals¹.

Concerning public revenue, this property of visibility has changed in the course of history, depending on both economic (as the development level of a country) and political (as mechanisms of fiscal illusion used by politicians, bureaucrats, and interest groups to overcome taxpayers' resistance) factors [Wagner, 1976; Borcharding, 1977; Buchanan and Wagner, 1977; Fiorina and Noll, 1978; Pommerehne and Schneider, 1978; Brennan and Buchanan, 1980; Frey and Pommerehne, 1982; Oates, 1988; Tullock, 1989; Tabellini and Alesina, 1990; Dunleavy, 1991; Mueller, 1993; Roig-Alonso, 1998; Roig-Alonso, 2000]. In a similar way, the compliance with such required property by fiscal systems now in force might differ remarkably among OECD countries.

With regard to public expenditure, the final or intermediate, the public or private nature, the spacial effects or dimensions, the administration costs, and other inherent characteristics of publicly provided goods and services represent major factors determining their benefit visibility [Weingast, Shepsle, and Johnsen, 1981; Solano, 1983; Hamilton, 1983; Becker, 1983, 1985; Mueller and Murell, 1985, 1986; Mueller, 1987; Wolff, 1987; Henrekson, 1992].

In any case, it is convenient to dispose of logical and general indicators permitting the measuring, as exactly as possible, of the extent to which the required property of visibility is achieved at all times by local, state, federal or confederal, supranational, and general fiscal sub-systems and systems of countries.

This contribution presents results and conclusions concerning:

A) The definition of the visibility of public revenue burden and public expenditure benefit in an operational way.

B) The identification of relevant factors generating problems of invisibility of public revenue and expenditure.

C) The construction of indicators to carry out historical and international comparisons.

In addition to this, taking the comparison of values for U.S.A. and European Union as a starting analytical point, this contribution presents estimates relating to the central government level of the European Union member countries and the federal and state government levels of U.S.A. by using statistical data and information from the International Monetary Fund, with conclusions and comments which can be helpful for a closer economic integration of the European countries. A general and significant policy implication of these estimates is confirmed: allocation improvements could be obtained in both European countries and U.S.A. by implementing changes and reforms aiming to raise the current visibility values of burden and benefit of public revenue and expenditure.

II. INDEX OF BURDEN VISIBILITY OF TOTAL PUBLIC REVENUE

In general, for every level, L , of territorial public administrations of an economy, a visibility index, V_L^R , of its total public revenue, R , can be defined in such a way that $0 \leq V_L^R \leq 1$, based on the following formula:

$$V_L^R = \sum_{i=1}^n x_{iL}^R y_{iL}^R$$

where:

- a) n = number of types of public revenue R for level L of territorial public administrations;
- b) x_{iL}^R = relative financial weight of public revenue R of type i for level L of territorial public administrations, with $i = 1, 2, \dots, n$; that is to say:

$$0 \leq x_{iL}^R = \frac{GF_{iL}^R}{\sum_{i=1}^n GF_{iL}^R} \leq 1$$

with GF_{iL}^R = absolute quantity of public revenue R of type i for level L of territorial public administrations;

- c) y_{iL}^R = visibility or perceptibility (for the policy intended - or legal - revenue-provider) factor of burden of public revenue R of type i to which level L of territorial public administrations is entitled, with $0 \leq y_{iL}^R \leq 1$.

III. BURDEN VISIBILITY OF A SPECIFIC PUBLIC REVENUE

An objective estimate of y_{iL}^R - factor of perceptibility of the direct burden by a policy intended - or legal - revenue-provider of a public revenue R of type i for level L of territorial public administrations - can be defined according to the following criteria:

$$y_{iL}^R = v_{iL}^R p_{iL}^R m_{iL}^R q_{iL}^R i_{iL}^R$$

where:

- a) v_{iL}^R = voluntary ($v_{iL}^R = 0$) or coercive ($v_{iL}^R = 1$) nature of public revenue R of type i for its policy intended - or legal - revenue-provider (coerciveness parameter), with $0 \leq v_{iL}^R \leq 1$.
- b) p_{iL}^R = full ($p_{iL}^R = 0$) or null ($p_{iL}^R = 1$) proportionality of the quantity of public revenue R of type i - the burden of which is borne by a policy intended - or legal - revenue-provider - to the cost of efficiently producing the good or service *specifically* received by him in return for his burden (proportionality parameter), with $0 \leq p_{iL}^R \leq 1$.
- c) m_{iL}^R = full ($m_{iL}^R = 1$) or null ($m_{iL}^R = 0$) information to the policy intended - or legal - revenue-provider on the concept of the direct burden he is bearing when providing public revenue R of type i (concept-information parameter), with $0 \leq m_{iL}^R \leq 1$.
- d) q_{iL}^R = full ($q_{iL}^R = 1$) or null ($q_{iL}^R = 0$) information to the policy intended - or legal - revenue-provider on the quantity of the direct burden he is bearing when providing public revenue R of type i (quantity-information parameter), with $0 \leq q_{iL}^R \leq 1$.
- e) i_{iL}^R = intermediate ($i_{iL}^R = 0$) or final ($i_{iL}^R = 1$) position of the policy intended - or legal - revenue-provider in relation to his direct burden (burden-shifting parameter), with $0 \leq i_{iL}^R \leq 1$.

In any case, all V_L^R , x_{iL}^R , y_{iL}^R , v_{iL}^R , p_{iL}^R , m_{iL}^R , q_{iL}^R and i_{iL}^R are continuous variables ranging from 0 to 1, i and L are subscripts for the type of revenue and level of territorial public administration respectively and R is a superscript - non an exponent - for public revenue.

IV. INDEX OF BENEFIT VISIBILITY OF TOTAL PUBLIC EXPENDITURE

The social benefit of a publicly supplied good or service is equal to its social production cost when these three conditions are simultaneously met:

- A) Resources of an economy are Pareto-efficiently allocated.
- B) Production is made at constant returns to scale.
- C) There is no consumer surplus.

When one or several of the previous conditions are not kept, the social cost of publicly supplying a good or service has to be corrected upward or downward in order for it to approximate its social benefit in money terms.

In any case, it is possible to consider the accounting production cost of a publicly supplied good or service as a first estimate of its social benefit in money terms, trying to identify final beneficiaries by applying a set of imputation criteria according to the economic nature of every type of good or service. In such a case, we should remember that every publicly supplied good or service can be:

A) Public (rival consumption is null), private (rival consumption is full), or mixed (rival consumption is partial).

B) Intermediate (production resource) or final (consumption resource).

Besides, a final good or service can be complementary, substitute, or independent in relation to the available personal income of a final consumer, and its re-distributive incidence will be regressive, progressive, or proportional. According to income-elasticities of demand, publicly supplied substitute goods are inferior (negative coefficient), whereas complementary goods are normal (positive coefficient).

In most cases a policy intended - or legal - consumer or user is quite aware of his personal benefit from a publicly supplied private good (for instance, a money grant), has an incomplete notion of the social benefit from a mixed good (like an education or health service), and fails to properly perceive the social benefit of a public good (defense, law and order, etc.). So, he faces important difficulties for assessing, in money terms, the social benefit - and even the countable cost - from many publicly supplied goods and services.

Usually, the problem of evaluating benefits of public supplied goods and services turns out to be complicated because the following considerations have to be taken into account:

A) Many types of publicly supplied services (*complex goods*) simultaneously have a) intermediate and final, b) public and private, c) substitute and complementary components, and these different parts are to be identified, characterized, and measured in separate ways.

B) The number and variety of types of publicly supplied goods and services is greater than that corresponding to types of public revenue.

C) A good or service can be supplied by a level of territorial public administration out of funds collected and granted by another level of territorial public administration.

Similarly to the case of public revenue, for every level of territorial public administrations, L , a general index, V_L^E , of benefit visibility of total public expenditure, E , can be defined in such a way that $0 \leq V_L^E \leq 1$, based on the following formula:

$$V_L^E = \sum_{f=1}^q x_{fL}^E y_{fL}^E$$

where:

a) q = number of types of public expenditure E performed by level L of territorial public administrations;

b) x_{fL}^E = relative financial weight of public expenditure E of type f performed by level L of territorial public administrations, with $f = 1, 2, \dots, q$; that is to say:

$$0 \leq x_{fL}^E = \frac{GF_{fL}^E}{\sum_{f=1}^q GF_{fL}^E} \leq 1$$

with $\mathbf{GF}_{\mathbf{fL}}^{\mathbf{E}}$ = absolute quantity of public expenditure \mathbf{E} of type \mathbf{f} performed by level \mathbf{L} of territorial public administrations;

c) $\mathbf{y}_{\mathbf{fL}}^{\mathbf{E}}$ = visibility or perceptibility (by the policy intended - or legal - consumer) factor of benefit of public expenditure \mathbf{E} of type \mathbf{f} performed by level \mathbf{L} of territorial public administrations, where $0 \leq \mathbf{y}_{\mathbf{fL}}^{\mathbf{E}} \leq 1$.

V. BENEFIT VISIBILITY OF A SPECIFIC PUBLIC EXPENDITURE

An objective estimate of $\mathbf{y}_{\mathbf{fL}}^{\mathbf{E}}$ (factor of perceptibility by a policy intended - or legal - consumer of the direct benefit of a public expenditure \mathbf{E} of type \mathbf{f} performed by level \mathbf{L} of territorial public administrations) can be defined according to the following criteria:

$$\mathbf{y}_{\mathbf{fL}}^{\mathbf{E}} = \mathbf{v}_{\mathbf{fL}}^{\mathbf{E}} \mathbf{p}_{\mathbf{fL}}^{\mathbf{E}} \mathbf{m}_{\mathbf{fL}}^{\mathbf{E}} \mathbf{q}_{\mathbf{fL}}^{\mathbf{E}} \mathbf{i}_{\mathbf{fL}}^{\mathbf{E}}$$

where:

a) $\mathbf{v}_{\mathbf{fL}}^{\mathbf{E}}$ = null ($\mathbf{v}_{\mathbf{fL}}^{\mathbf{E}} = 0$) or full ($\mathbf{v}_{\mathbf{fL}}^{\mathbf{E}} = 1$) consumption of a publicly supplied good of type \mathbf{f} by its policy intended - or legal - user or beneficiary (consumption parameter), with $0 \leq \mathbf{v}_{\mathbf{fL}}^{\mathbf{E}} \leq 1$.

b) $\mathbf{p}_{\mathbf{fL}}^{\mathbf{E}}$ = full ($\mathbf{p}_{\mathbf{fL}}^{\mathbf{E}} = 0$) or null ($\mathbf{p}_{\mathbf{fL}}^{\mathbf{E}} = 1$) proportionality of cost of efficient production of the publicly supplied good of type \mathbf{f} to a *specifically requited monetary burden* borne by the policy intended - or legal - user or beneficiary (proportionality parameter), with $0 \leq \mathbf{p}_{\mathbf{fL}}^{\mathbf{E}} \leq 1$.

c) $\mathbf{m}_{\mathbf{fL}}^{\mathbf{E}}$ = full ($\mathbf{m}_{\mathbf{fL}}^{\mathbf{E}} = 1$) or null ($\mathbf{m}_{\mathbf{fL}}^{\mathbf{E}} = 0$) information to the policy intended - or legal - consumer or user on the concept of the direct benefit he is receiving when public expenditure \mathbf{E} of type \mathbf{f} is being performed (concept-information parameter), with $0 \leq \mathbf{m}_{\mathbf{fL}}^{\mathbf{E}} \leq 1$.

d) $\mathbf{q}_{\mathbf{fL}}^{\mathbf{E}}$ = full ($\mathbf{q}_{\mathbf{fL}}^{\mathbf{E}} = 1$) or null ($\mathbf{q}_{\mathbf{fL}}^{\mathbf{E}} = 0$) information to the policy intended - or legal - consumer or user on the quantity of the direct benefit he is receiving when public expenditure \mathbf{E} of type \mathbf{f} is performed (quantity-information parameter), with $0 \leq \mathbf{q}_{\mathbf{fL}}^{\mathbf{E}} \leq 1$.

e) $\mathbf{i}_{\mathbf{fL}}^{\mathbf{E}}$ = intermediate ($\mathbf{i}_{\mathbf{fL}}^{\mathbf{E}} = 0$) or final ($\mathbf{i}_{\mathbf{fL}}^{\mathbf{E}} = 1$) position of the policy intended - or legal - user or beneficiary of the publicly supplied good of type \mathbf{f} in relation to his direct benefit (benefit-shifting parameter), with $0 \leq \mathbf{i}_{\mathbf{fL}}^{\mathbf{E}} \leq 1$.

Similarly to the previous case of public revenue, all $\mathbf{V}_{\mathbf{L}}^{\mathbf{E}}$, $\mathbf{x}_{\mathbf{fL}}^{\mathbf{E}}$, $\mathbf{y}_{\mathbf{fL}}^{\mathbf{E}}$, $\mathbf{v}_{\mathbf{fL}}^{\mathbf{E}}$, $\mathbf{p}_{\mathbf{fL}}^{\mathbf{E}}$, $\mathbf{m}_{\mathbf{fL}}^{\mathbf{E}}$, $\mathbf{q}_{\mathbf{fL}}^{\mathbf{E}}$ and $\mathbf{i}_{\mathbf{fL}}^{\mathbf{E}}$ are continuous variables always ranging from 0 to 1, \mathbf{f} and \mathbf{L} are subscripts for the type of public expenditure and level of territorial public administration respectively and \mathbf{E} is a superscript - non an exponent - for public expenditure.

VI. ESTIMATES ON BURDEN VISIBILITY OF TOTAL PUBLIC REVENUE

Tables 2 and 3 present estimates on burden visibility of public revenue and grants of the European Union member countries and USA, obtained by applying index

previously defined, to the central, federal and State fiscal sub-systems now in force in these countries.

To obtain a sensitivity analysis, three hypotheses on minimum, plausible and maximum shifting of tax burden have been assumed, giving rise to the corresponding series of maximum, V_M , plausible, V_p , and minimum, V_m , values of weighted-visibility estimates of revenue burden for policy intended - or legal - revenue-providers. The initial values for the fiscal visibility parameters v , p , m , q , i_M , i_p , i_m - shown in Table 1 - have been deducted and imputed after carefully analysing all the information provided by both the International Monetary Fund and the Commission of the European Communities on the internal structure of each type of public revenue.

19.2. Capital	0.00	1.00	0.00	0.00			
20. Grants to supranational authorities							
20.1. Current	0.00	1.00	0.00	0.00			
20.2. Capital	0.00	1.00	0.00	0.00			
DEFICIT	0.00	0.00	1.00	1.00			

Notes for table 1:

v = degree of coercion of public revenue for its legal provider.

p = degree of specific requital of public revenue for its legal provider.

m = degree of information on the public revenue concept for its legal provider.

q = degree of information on the public revenue quantity for its legal provider.

i_M = maximum incidence of the direct monetary burden onto the legal provider of public revenue.

i_p = plausible incidence of the direct monetary burden onto the legal provider of public revenue.

i_m = minimum incidence of the direct monetary burden onto the legal provider of public revenue.

Source: own elaboration from data on *Government Finance Statistics Yearbook 1994*, volume XVIII, International Monetary Fund, Washington, 1994.

As regards results:

A) According to Table 2, presenting **V_M**, **V_p** and **V_m** visibility estimates of burden of revenue and grants for the consolidated central government level of the total fifteen European Union member countries and the consolidated federal government level of U.S.A., this country, with values of 80.89%, 53.42% and 25.95%, has the most visible sub-system, the European Union having the least visible one, with 68.19%, 45.70% and 23.34%.

B) According to Table 3, presenting **V_M**, **V_p** and **V_m** visibility estimates of burden revenue and grants for the consolidated central government level of the total fifteen European Union member countries and the consolidated State government level of the total fifty States of U.S.A., this country, with values of 35.84%, 25.65% and 15.55%, has the least visible state sub-system, the European Union having the most visible one, with 68.19%, 45.70% and 23.34% as previously shown.

TABLE 2
Estimates of Burden Visibility of Public Revenue and Grants in the European Union (Consolidated Central Government Level) and USA (Consolidated Federal Government Level)

Countries / Years	V_M	V_p	V_m
European Union (weighted averages for fifteen countries), several years	68.19%	45.70%	23.34%
USA, 1996	80.89%	53.42%	25.95%

Footnotes for table 2:

V_M = maximum visibility estimates of revenue burden for the legal revenue provider.

V_p = plausible visibility estimates of revenue burden for the legal revenue provider.

V_m = minimum visibility estimates of revenue burden for the legal revenue provider.

Source: own elaboration from data in *Government Finance Statistics Yearbook 1998*, International Monetary Fund, Washington, 1999.

TABLE 3
Estimates of Burden Visibility of Public Revenue and Grants in the European Union (Consolidated Central Government Level) and USA (Consolidated State Government Level)

Countries / Years	V_M	V_p	V_m
European Union (weighted averages for fifteen countries), several years	68.19%	45.70%	23.34%
USA, 1996	35.84%	25.65%	15.55%

Footnotes for table 3:

V_M = maximum visibility estimates of revenue burden for the legal revenue provider.

V_p = plausible visibility estimates of revenue burden for the legal revenue provider.

V_m = minimum visibility estimates of revenue burden for the legal revenue provider.

VII. ESTIMATES ON BENEFIT VISIBILITY OF TOTAL PUBLIC EXPENDITURE

In turn, tables 5 and 6 present estimates on benefit visibility of public expenditure and grants of the European Union member countries and USA, obtained by applying index

$$V_L^E = \sum_{j=1}^q x_{jL}^E y_{jL}^E$$

previously defined, to the central, federal and State fiscal sub-systems now in force in these countries.

Such values have been calculated mainly from information and primary data on public cash flows provided by the International Monetary Fund⁴.

As before, three hypotheses on minimum, plausible and maximum shifting of expenditure benefit have been assumed to obtain a sensitivity analysis, giving rise to the corresponding series of maximum, V_M , plausible, V_p , and minimum, V_m , values of weighted-visibility estimates of expenditure benefit for the policy intended - or legal - beneficiary of every type of good and service publicly provided. The initial approximate values for the fiscal visibility parameters v , p , m , q , i_M , i_p , i_m - now shown in Table 4 - have been deducted and imputed after carefully analysing all the information facilitated by the International Monetary Fund on the internal structure of each type of public expenditure.

TABLE 4
Values Imputed to Fiscal Visibility Parameters of Public Expenditure
(approximate average values)

Public Expenditure Concepts	v	p	m	q	i_M	i_p	i_m
1. General public services							
1.1. Executive and legislative organs, financial and fiscal affairs, external affairs other than foreign aid	1.00	1.00	1.00	0.50	0.75	0.50	0.25
1.2. Foreign economic aid	1.00	1.00	1.00	0.50	0.75	0.50	0.25
1.3. Fundamental research affairs and services	1.00	1.00	0.25	0.25	0.75	0.50	0.25
1.4. General services	1.00	1.00	1.00	0.50	0.75	0.50	0.25
1.5. General public services not elsewhere classified	1.00	1.00	1.00	0.50	0.75	0.50	0.25
2. Defense affairs and services							
2.1. Military and civil defense administration and operation	1.00	1.00	1.00	0.50	0.75	0.50	0.25
2.2. Foreign military aid	1.00	1.00	1.00	0.50	0.75	0.50	0.25
2.3. Defense-related applied research and experimental development	1.00	1.00	0.25	0.25	0.75	0.50	0.25

2.4. Defense affairs not elsewhere classified	1.00	1.00	1.00	0.50	0.75	0.50	0.25
3. Public order and safety affairs							
3.1. Police and fire protection	1.00	1.00	1.00	0.50	0.75	0.50	0.25
3.2. Law courts	1.00	0.75	1.00	0.50	0.75	0.50	0.25
3.3. Prison administration and operation	1.00	1.00	1.00	0.50	0.75	0.50	0.25
3.4. Public order and safety affairs not elsewhere classified	1.00	1.00	1.00	0.50	0.75	0.50	0.25
4. Education affairs and services

Notes for table 4:

v = degree of consumption of a publicly supplied good by the policy-intended or legal beneficiary.

p = degree of proportional cost of the efficient production of the publicly supplied good to a specifically required monetary burden born by the policy-intended or legal beneficiary.

m = degree of information to the policy-intended or legal beneficiary on the concept of the direct benefit he is receiving when public expenditure is being performed.

q = degree of information to the policy-intended or legal beneficiary on the quantity of the direct benefit he is receiving when public expenditure is being performed.

i_M = maximum incidence of the direct monetary benefit onto the policy-intended or legal beneficiary of a publicly supplied good.

i_p = plausible incidence of the direct monetary benefit onto the policy-intended or legal beneficiary of a publicly supplied good.

i_m = minimum incidence of the direct monetary benefit onto the policy-intended or legal beneficiary of a publicly supplied good.

As regards results:

A) According to Table 5, presenting V_M , V_p and V_m visibility estimates of public expenditure for the consolidated central government level of the total fifteen European Union member countries and the consolidated federal government level of U.S.A., this country, with values of 38.94%, 29.16% and 19.39%, has the least visible fiscal sub-system, the European Union having the most visible one, with 39.89%, 29.57% and 19.65%. But now differences between European Union and U.S.A. are not significant.

B) According to Table 6, presenting V_M , V_p and V_m visibility estimates of public expenditure for the consolidated central government level of the total fifteen European Union member countries and the consolidated State government level of the total fifty States of U.S.A., again this country, with values of 37.86%, 27.57% and 17.28%, has the least visible fiscal sub-system, the European Union having the most visible one, with 39.89%, 29.57% and 19.65% as previously shown.

TABLE 5
Estimates of Benefit Visibility of Public Expenditure and Grants in the European Union (Consolidated Central Government Level) and USA (Federal Government Level)

Countries / Years	V_M	V_p	V_m
European Union (weighted averages for fifteen countries), several years	39.89%	29.57%	19.65%
USA, 1996	38.94%	29.16%	19.39%

Footnotes for table 5:

V_M = maximum visibility estimates of revenue burden for the legal revenue provider.

V_p = plausible visibility estimates of revenue burden for the legal revenue provider.

V_m = minimum visibility estimates of revenue burden for the legal revenue provider.

Source: own elaboration from data in *Government Finance Statistics Yearbook 1998*, International Monetary Fund, Washington, 1999.

TABLE 6
Estimates of Benefit Visibility of Public Expenditure and Grants in the European Union (Consolidated Central Government Level) and USA (State Government Level)

Countries / Years	V_M	V_p	V_m
European Union (weighted averages for fifteen countries), several years	39.89%	29.57%	19.65%
USA, 1996	37.86%	27.57%	17.28%

Footnotes for table 6

V_M = maximum visibility estimates of revenue burden for the legal revenue provider.

V_p = plausible visibility estimates of revenue burden for the legal revenue provider.

V_m = minimum visibility estimates of revenue burden for the legal revenue provider.

VIII. CONCLUSIONS

The quality of public revenue and expenditure sub-systems and systems as policy instruments for efficiently allocating economic resources among private and public sectors and sub-sectors varies as a result of economic, political, and social factors.

The indices of fiscal visibility previously defined bring forward a general measurement methodology which can be used to make relevant quantified comparisons among member countries of the International Monetary Fund provided that detailed statistic figures on execution of public budgets as well as information about the nature of the different types of public administrations' revenue and expenditure programmes are available to researchers.

Estimates obtained from different assumptions on tax and expenditure shifting by applying these indices to measure the visibility of revenue burden and expenditure benefit of central, federal and State fiscal sub-systems now in force in the European Union member countries and U.S.A. show:

First.- Low values of burden visibility for all these countries in general. Such general low values stem from the concurrence of several factors such as non-coerciveness, non-existence of specific requitals, lack of information on concepts and quantities, partial shifting of burden by tax-payers, intergovernmental grants, etc.

Second.- Still lower values of benefit visibility for the same countries, specially owing to the fact that beneficiaries of goods and services are not properly informed on costs for the public provision of such goods and services.

Third.- The burden visibility is higher than the benefit visibility in both the European Union and U.S.A. - except for the state government level in U.S.A.-, suggesting a possible tendency - to be confirmed and analysed - to publicly under-provide goods and services in such countries.

Fourth.- Policy implications of these estimates seem straightforward for the European Union and U.S.A.: as both present revenue and benefit visibility are low in general, allocation improvements could be obtained by implementing changes and reforms to raise values in general and by approaching these two types of budget visibility to the ideal value of 100.00%.

FOOTNOTES

¹By revenue visibility we mean visibility of *direct burden* of public revenue. Some types of public revenue (for instance, revenue from public property) do not involve any burden in the strict sense here reserved for this term. Symmetrically, by public expenditure visibility, visibility of *direct benefit* of public expenditure must be understood. Again, some types of public expenditure (for example, public purchases of private financial assets at market prices) might not carry any benefit with them.
